

PONDS AND WATER RESERVOIRS

Our supplied Reinforced Polyethylene (RPE) Geomembranes are the best solution you can use as a bottom liner and floating cover in the ponds, lagoons and water channels.

Polyethylene (RPE) Geomembranes, in relation to its low weight and nominal thickness, is characterized by a high tensile and static puncture strength and achieves features which are equal, or even higher, to those of traditional Geomembranes.

It can be supplied in different sizes, pre-welded in our factory panels; available up to 7500 msq in one single panel that enables a big savings on welding (workmanship) and easy/fast installation thanks to its light material.

convex is the sole agent of G&G Partners S.r.l. in Turkey.
